

Figure 1. The effect of the number of trials on the mean error rate (\pm SEM) for each condition. Error rates were significantly lower for the 80-trial condition than for the 40-trial condition ($p < .001$). Error rates were also significantly lower for the 80-trial condition than for the 160-trial condition ($p < .001$) for the no feedback condition. Error rates were not significantly different between the 40- and 160-trial conditions for either the feedback or no feedback conditions.
